Question 1:

```
Z:\CS432\A10>python kmeasure.py
44.0
44.5
38.0
29.7
28.05
50.0
41.0
29.0
33.8
30.1

Z:\CS432\A10>
```

```python
def knnestimate(data,vec1,k=3):
    dlist=getdistances(data,vec1)
    avg=0.0

    for i in range(k):
        idx=dlist[i][1]
        avg+= idx
    avg=avg/k
    return avg
```

K-Estimate Computations:

44.0
44.5
38.0
29.7
28.05
50.0
41.0
29.0
33.8
30.1

After obtaining the necessary functions from the Collective Intelligence Programming textbook, the computations were able to be done correctly.

Question 2:

```
atria.cs.odu.edu - PuTTY

atria:~/CS432/A10> python libvsmCizer.py
Cancer:
        not-Zika
        not-Research
        not-Ebola
        not-HIV
        not-Outbreak

HIV:
        not-Zika
        not-Research
        not-Cancer
        not-Ebola
        not-Outbreak

Research:
        not-Zika
        not-Cancer
        not-Ebola
        not-HIV
        not-Outbreak

Ebola:
        not-Zika
        not-Research
        not-Cancer
        not-HIV
        not-Outbreak

Outbreak:
        not-Zika
        not-Research
        not-Cancer
        not-Ebola
        not-HIV

Zika:
        not-Research
        not-Cancer
        not-Ebola
        not-HIV
        not-Outbreak

atria:~/CS432/A10>
```

For question 2, I was able to figure out the LIBVSM scheme, however the 500 term vectors and 10-fold cross-validations was rather confusing. I researched on it for a while trying to figure out on how to implement it but no such luck. I was able actually get the categories to Classify with the result classified with its opposites.

Question 3 (Extra Credit):

Updated Histogram

URIs vs Mementos
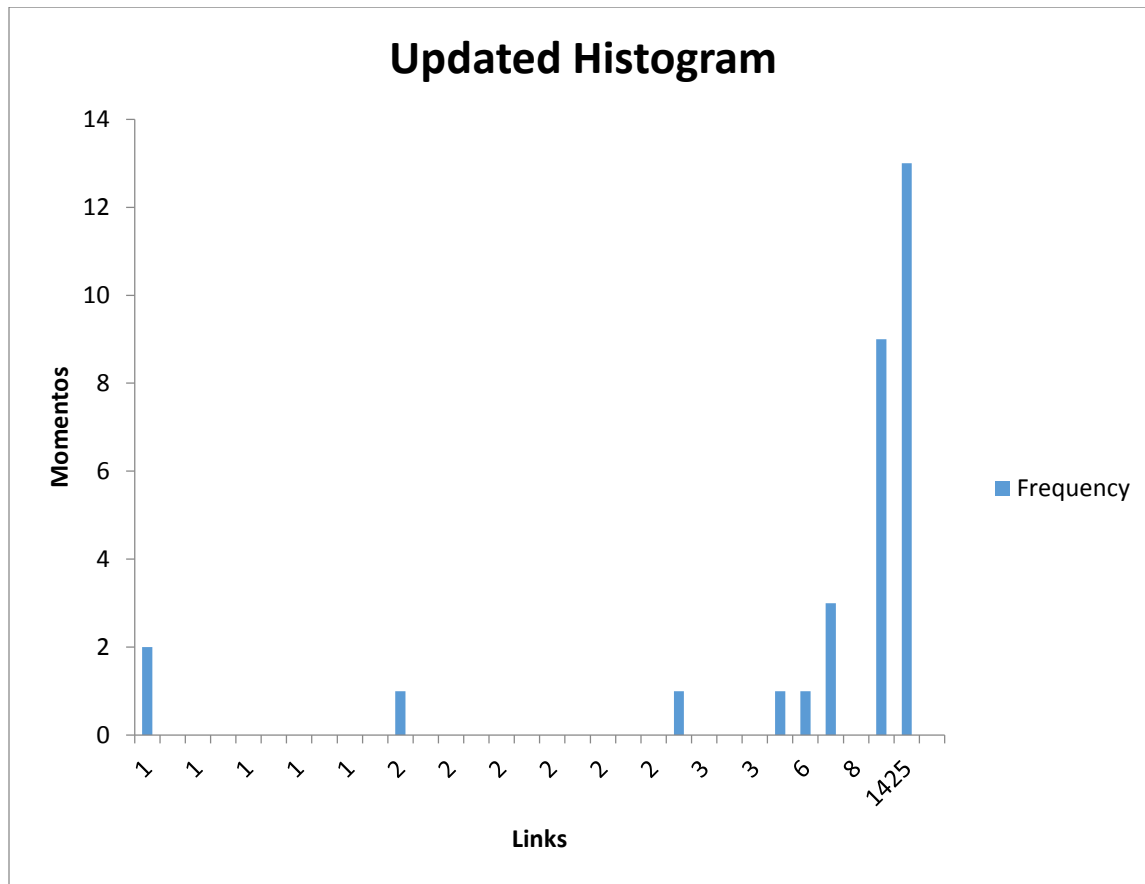

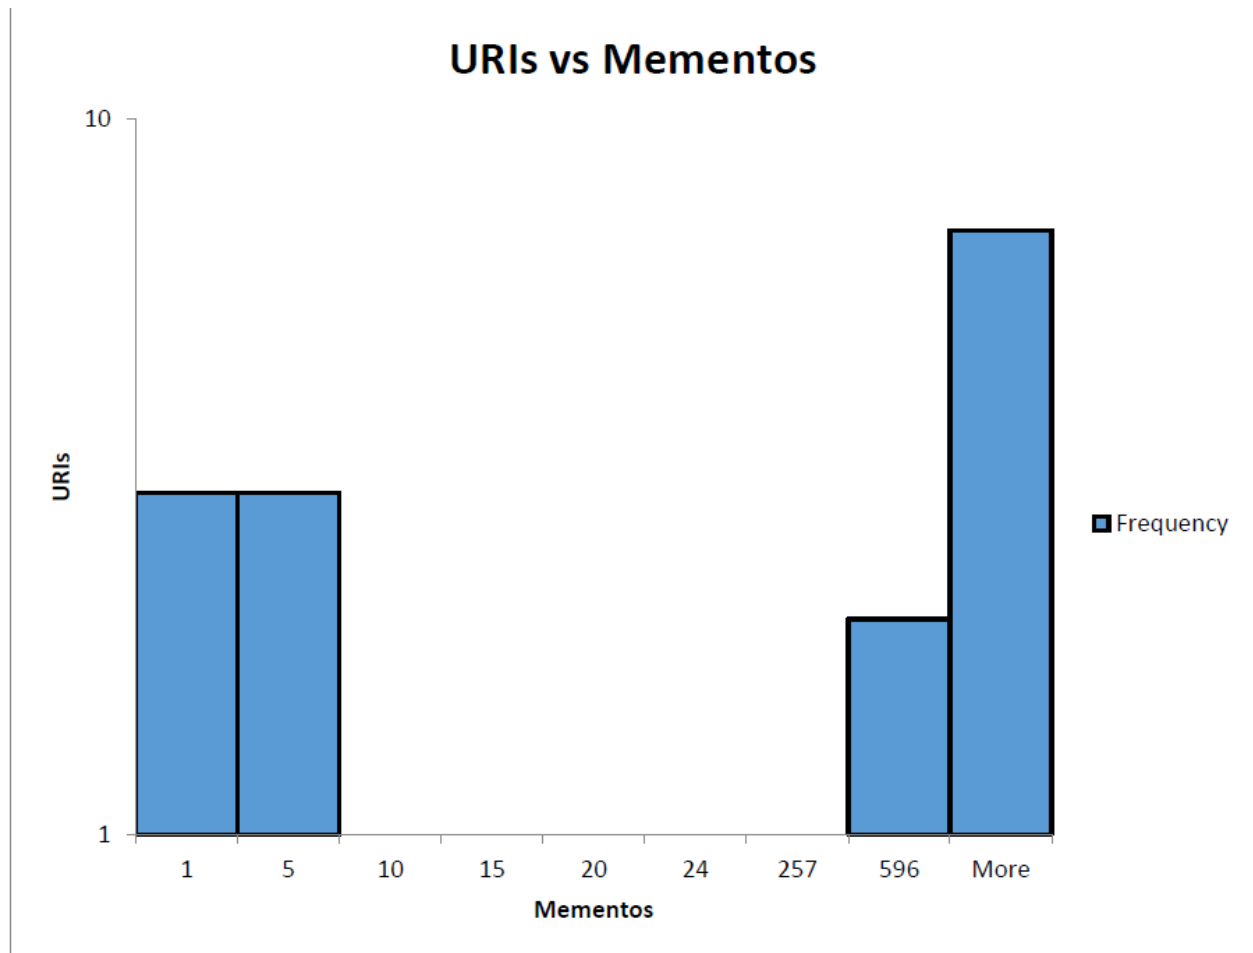

For the Extra Credit question 3, the first graph is an updated histogram compared to the old one. As it can be seen the graphs differ when it was produced in Assignment 2.
